Title: Chief Financial Officer

Innate Pharma to Present Additional Efficacy Data for Monalizumab in Combination With Cetuximab in Head and Neck Cancer at the ESMO Immuno-Oncology Virtual Congress

Phase 2 expansion cohort data supports ongoing Phase 3 trial

MARSEILLE, France, Dec. 03, 2020 (GLOBE NEWSWIRE) -- Innate Pharma SA (Euronext Paris: IPH – ISIN: FR0010331421; Nasdaq: IPHA) (“**Innate**” or the “**Company**”) today announced that it will present additional data on its lead partnered asset, monalizumab, at the ESMO Immuno-oncology Virtual Congress being held from Dec. 9-12, 2020. Monalizumab is a potentially first-in-class immune checkpoint inhibitor targeting NKG2A receptors expressed on tumor infiltrating cytotoxic CD8⁺ T cells and NK cells.

The presentation will include updated results from a Phase 2 study investigating the combination of monalizumab and cetuximab in patients with recurrent or metastatic head and neck squamous cell cancer (R/M SCCHN) who have been previously treated with a platinum-based chemotherapy and PD-(L)1 inhibitor.

The e-poster presentation (#81P, abstract #235) entitled, “*Monalizumab in combination with cetuximab post platinum and anti-PD-(L)1 in patients with recurrent/metastatic squamous cell carcinoma of the head and neck: Updated results from a phase 2 trial*” will be available on Dec. 9th.

As recently announced, AstraZeneca dosed the first patient in its Phase 3 clinical trial, INTERLINK-1, evaluating monalizumab in combination with cetuximab in R/M SCCHN patients who have been previously treated with a platinum-based chemotherapy and PD-(L)1 inhibitors.

About INTERLINK-1:

Sponsored by AstraZeneca, INTERLINK-1 is a global, multi-center, randomized, double-blind Phase 3 study of monalizumab and cetuximab vs. placebo and cetuximab that will enroll approximately 600 patients with recurrent or metastatic head and neck squamous cell carcinoma of the head and neck (R/M SCCHN) who have been previously treated with a platinum-based chemotherapy and PD-(L)1 inhibitor (“IO-pretreated”).

The primary endpoint is overall survival (OS) with secondary endpoints including progression-free survival (PFS), overall response rate (ORR), duration of response (DoR), safety and quality of life. Additional details on the INTERLINK-1 clinical trial can be found here.

About the Innate-AstraZeneca monalizumab agreement:

On April 24, 2015, the Company signed a codevelopment and commercialization agreement with AstraZeneca to accelerate and broaden the development of monalizumab.

The financial terms of the agreement include potential cash payments up to \$1.275 billion to Innate Pharma. Including the \$50 million payment triggered by dosing the first patient in the Phase 3 INTERLINK-1 clinical trial, Innate Pharma has received \$400 million to date.

AstraZeneca will book all sales revenue and will pay Innate low double-digit to mid-teen percentage royalties on net sales worldwide except in Europe where Innate Pharma will receive 50% share of the profits and losses in the territory. Innate will co-fund 30% of the costs of the Phase 3 development program of monalizumab with a pre-agreed limitation of Innate’s financial commitment.

About Monalizumab:

Monalizumab is a potentially first-in-class immune checkpoint inhibitor targeting NKG2A receptors expressed on tumor infiltrating cytotoxic CD8⁺ T cells and NK cells.

NKG2A is an inhibitory checkpoint receptor for HLA-E. By expressing HLA-E, cancer cells can protect themselves from killing by NKG2A⁺ immune cells. HLA-E is frequently overexpressed in the cancer cells of many solid tumors and hematological malignancies. Monalizumab may re-establish a broad anti-tumor response mediated by NK and T cells, and may enhance the cytotoxic potential of other therapeutic antibodies (André et al, *Cell* 2018).

AstraZeneca obtained full oncology rights to monalizumab in October 2018 through a co-development and commercialization agreement initiated in 2015. The ongoing development for monalizumab is focused on investigating monalizumab in various combination strategies in different malignancies.

About Cetuximab:

Cetuximab (Erbix[®]) is an anti-EGFR monoclonal antibody. NK cells mediate cetuximab-induced antibody dependent cellular cytotoxicity (ADCC) against SCCHN. Genetic and preclinical experiments suggest that ADCC can be enhanced by NK-stimulators.

The activity of cetuximab as a single agent in recurrent and/or metastatic SCCHN is limited, with a 12.6% overall response rate, a median time to progression of 2.3 months and a median overall survival of 5.8 months (Vermorken et al, *JCO* 2007).

About Innate Pharma:

Innate Pharma S.A. is a commercial stage oncology-focused biotech company dedicated to improving treatment and clinical outcomes for patients through therapeutic antibodies that harness the immune system to fight cancer.

Innate Pharma's commercial-stage product, Lumoxiti, in-licensed from AstraZeneca in the US, EU and Switzerland, was approved by the FDA in September 2018. Lumoxiti is a first-in class specialty oncology product for hairy cell leukemia. Innate Pharma's broad pipeline of antibodies includes several potentially first-in-class clinical and preclinical candidates in cancers with high unmet medical need.

Innate has been a pioneer in the understanding of natural killer cell biology and has expanded its expertise in the tumor microenvironment and tumor-antigens, as well as antibody engineering. This innovative approach has resulted in a diversified proprietary portfolio and major alliances with leaders in the biopharmaceutical industry including Bristol-Myers Squibb, Novo Nordisk A/S, Sanofi, and a multi-products collaboration with AstraZeneca.

Based in Marseille, France, Innate Pharma is listed on Euronext Paris and Nasdaq in the US.
